HISTORY OF THE DRUG: AZT

Who discovered the drug?

In 1983 researchers at the Institute Pasteur in Paris indentified the retroviruses now known as (HIV) as the cause of (AIDS)

When was the drug first introduced?

*The drug was first introduced on March 19, 1987
when it was approved by the FDA. It was
approved in record time with only one trial*

*When did it become a therapeutic
medicine?*

*The first AIDS drug was approved on March 19, 1987.
The therapy is not really clear but it was approved
around the 80s and 90s*

Which disease does this drug treats?

*What causes the disease in the
body?*

*This drug treats HIV/AIDS it is recommended for use
of antiretrovirals. What causes it is human
transmutation, sexual inter course or blood flow.*

How long does the drug work in the body to cure the disease?

It goes in your system and goes with the infected HIV cell and makes it produce fewer viruses.

Is the drug very effective in the treatment of the disease?

It is effective if you choose the right drug out of 41 it can treat the disease if you take the right combination at the right time

*How does the drug cause
undesired side effects?*

*The side effects of AZT nausea, vomiting,
headaches, dizziness, weakness and muscle pain.*

Is the drug expensive?

*Yes the drug is expensive it cost 10,000
yearly.*

Sales: For how millions of dollars is the drug sold yearly?

It is sold for 125 million yearly.
