

## PhET simulation: Hooke's Law

**Hooke's Law:** The amount of deformation-displacement (extension or compression) of an elastic object (such as spring) is proportional to the forces applied to deform it.

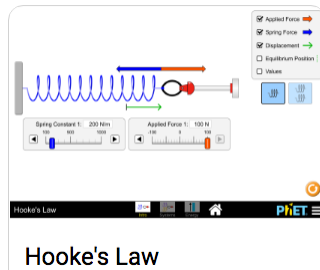

Equation:  $F_s = K X$

$F_s$  is the forces exerted on the deformed spring, in newtons.

$X$  is the amount of displacement of the spring, in meters

$K$  is the spring constant in newtons per meter.

**Elastic Potential Energy :  $U = 1/2 ( K X^2)$**

**Design an experiment** and use the formulas of Hooke's Law and Elastic Potential Energy;

**Idea:** Calculate the values and prove that the calculated values are those given experimentally by PhET simulation. Use both Hooke's law and the Elastic Potential Energy Formulas.

## PhET simulation: Masses and Springs: Basics

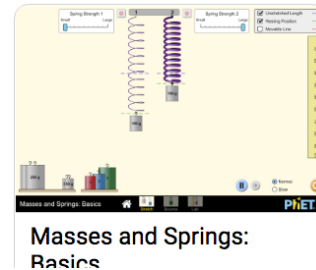

**Hooke's Law:** The amount of deformation-displacement (extension or compression) of an elastic object (such as spring) is proportional to the forces applied to deform it.

Equation:  $F_s = K X$

$F_s$  is the forces exerted on the deformed spring, in newtons.

$X$  is the amount of displacement of the spring, in meters

$K$  is the spring constant in newtons per meter.

**Design an experiment** and use the formulas of Hooke's Law and calculate the mass of one unknown.

**Idea:** Calculate the values and prove that the calculated values are those given experimentally by PhET simulation. Use both Hooke's law.

**Change the Gravity:** Use different planets. Write a conclusion
